

CENTRALIZED FILTER

A solution that guarantees more harmony and well-being in the environment, favoring workstations with a reduced impact of pollutants in the air, among its advantages are the simple access and maintenance, all with a “green” environmental impact. We install a silenced suction system that is unique in the filtration panorama, so it is also possible to position them in production departments with operators present.

Our centralized filters can be applied to silos, mixers and centralized transport systems. They are suitable for indoor and/or outdoor use thanks to our “Rainproof” technology and they are equipped with 3 circular LEDs to indicate the regular trend, clogging or maintenance request.

Applicable also to existing plants, they have superfiltering sleeves that comply with the strictest regulations in the sector.
